

How to Give a Doctor Access

CuraNova Physician Portal · about 2 minutes per doctor · repeat these steps for every new doctor

Do this **every time you add a new doctor**. Each doctor gets their **own login** and their **own one-line entry** in the system. When you finish, that doctor can sign in and see **only their own patients** — nobody else's.

1

CREATE LOGIN

Make the doctor a login

In Supabase, go to `Authentication → Users → Add user → Create new user`.

Type the doctor's **email** and a **password**, tick **Auto Confirm User**, then click **Create user**.

The **password you type here is the doctor's access code**. Write it down — you'll give it to them at the end. Use a different password for each doctor.

2

OPEN SQL

Open a fresh query

Go to `SQL Editor` and click **+ New query**.

New doctor = new query. Always click **+ New query** for each doctor (or clear the box first). **Do not edit a previous doctor's line** — start fresh each time. One doctor = one line, run on its own.

3

MARK AS DOCTOR

Tell the system this email is a physician

Paste this in, change the **3 highlighted values**, then click **Run**:

```
-- change the 3 highlighted values, then Run
insert into profiles (id, role, physician_name, full_name)
select id, 'physician', 'Haddad', 'Dr. Elie Haddad'
from auth.users
where email = 'doctor@email.com'
on conflict (id) do update
  set role = excluded.role,
      physician_name = excluded.physician_name,
      full_name = excluded.full_name;
```

doctor@email.com The doctor's email — **exactly** the same one you typed in Step 1.

Haddad The doctor's name **exactly as your nurses type it** in the patient's "Referring physician" box.

Dr. Elie Haddad The doctor's full name — this is just how their name is shown on screen.

The middle value (**Haddad**) is the important one. It must match the referring-physician name on the patients — if it doesn't match anything, the doctor will correctly see **no patients at all**.

4

CHECK

Make sure it worked

Click + **New query**, paste this (change the email to the same one), and **Run**:

```
select u.email, p.role, p.physician_name
from auth.users u left join profiles p on p.id = u.id
where u.email = 'doctor@email.com';
```

✓ You should see **physician** under **role**. ✗ If it says **null**, the line didn't run — go back to Step 3 and Run it again.

5**SEND**

Give the doctor 3 things

Send the doctor these three things — that's all they need:

- 1 The **website link** to CuraNova.
- 2 Their **email**.
- 3 Their **password** (the access code from Step 1).

- ✓ They open the link, enter their email and password, and they're in — seeing only their own patients, read-only. If they were already signed in, they should **sign out and back in** once.

Same query or a new one?

A new one, every time. Each doctor is one separate line with **their** email and name. Click + New query for each doctor. Never pile several doctors into one line, and never overwrite an old doctor's entry.

Remove or change a doctor

- **Remove access:** Authentication → Users → delete the user (or change their password).
- **Change what they see:** re-run Step 3 with a different middle name value.

CuraNova · Home Nursing — Advanced Wound Care · keep each doctor's access code private, share it only with that doctor.
